## INHIBITORS OF PHOSPHOLIPASE ENZYMES

### Background of the Invention

10

The present invention relates to chemical inhibitors of the activity of various phospholipase enzymes, particularly phospholipase A<sub>2</sub> enzymes.

15       Leukotrienes and prostaglandins are important mediators of inflammation, each of which classes contributes to the development of an inflammatory response in a different way. Leukotrienes recruit inflammatory cells such as neutrophils to an inflamed site, promote the extravasation of these cells and stimulate release of superoxide and proteases which damage the tissue. Leukotrienes also play a pathophysiological role in the hypersensitivity experienced by  
20       asthmatics [See, e.g. B. Samuelson et al., *Science*, 237:1171-76 (1987)]. Prostaglandins enhance inflammation by increasing blood flow and therefore infiltration of leukocytes to inflamed sites. Prostaglandins also potentiate the pain response induced by stimuli.

25       Prostaglandins and leukotrienes are unstable and are not stored in cells, but are instead synthesized [W. L. Smith, *Biochem. J.*, 259:315-324 (1989)] from arachidonic acid in response to stimuli. Prostaglandins are produced from arachidonic acid by the action of COX-1 and COX-2 enzymes. Arachidonic acid is also the substrate for the distinct enzyme pathway leading to the production of leukotrienes.

30

Arachidonic acid which is fed into these two distinct inflammatory pathways is released from the sn-2 position of membrane phospholipids by phospholipase A<sub>2</sub> enzymes (hereinafter PLA<sub>2</sub>). The reaction catalyzed by PLA<sub>2</sub> is believed to represent the rate-limiting step in the process of lipid mediated biosynthesis and the production of inflammatory prostaglandins and  
35       leukotrienes. When the phospholipid substrate of PLA<sub>2</sub> is of the phosphatidyl choline class with an ether linkage in the sn-1 position, the lysophospholipid produced is the immediate precursor of platelet activating factor (hereafter called PAF), another potent mediator of inflammation [S.I. Wasserman, *Hospital Practice*, 15:49-58 (1988)].

40       Most anti-inflammatory therapies have focussed on preventing production of either prostaglandins or leukotrienes from these distinct pathways, but not on all of them. For

5 example, ibuprofen, aspirin, and indomethacin are all NSAIDs which inhibit the production of  
prostaglandins by COX-1/COX-2, but have no effect on the inflammatory production of  
leukotrienes from arachidonic acid in the other pathways. Conversely, zileuton inhibits only  
the pathway of conversion of arachidonic acid to leukotriene, without affecting the production  
of prostaglandins. None of these widely-used anti-inflammatory agents affects the production  
10 of PAF.

Consequently the direct inhibition of the activity of PLA<sub>2</sub> has been suggested as a  
useful mechanism for a therapeutic agent, i.e., to interfere with the inflammatory response.  
[See, e.g., J. Chang et al, Biochem. Pharmacol., 36:2429-2436 (1987)].

15 A family of PLA<sub>2</sub> enzymes characterized by the presence of a secretion signal  
sequenced and ultimately secreted from the cell have been sequenced and structurally defined.  
These secreted PLA<sub>2</sub>s have an approximately 14 kD molecular weight and contain seven  
disulfide bonds which are necessary for activity. These PLA<sub>2</sub>s are found in large quantities in  
20 mammalian pancreas, bee venom, and various snake venom. [See, e.g., references 13-15 in  
Chang et al, cited above; and E. A. Dennis, Drug Devel. Res., 10:205-220 (1987).] However,  
the pancreatic enzyme is believed to serve a digestive function and, as such, should not be  
important in the production of the inflammatory mediators whose production must be tightly  
regulated.

25 The primary structure of the first human non-pancreatic PLA<sub>2</sub> has been determined.  
This non-pancreatic PLA<sub>2</sub> is found in platelets, synovial fluid, and spleen and is also a secreted  
enzyme. This enzyme is a member of the aforementioned family. [See, J. J. Seilhamer et al,  
J. Biol. Chem., 264:5335-5338 (1989); R. M. Kramer et al, J. Biol. Chem., 264:5768-5775  
30 (1989); and A. Kando et al, Biochem. Biophys. Res. Comm., 163:42-48 (1989)]. However,  
it is doubtful that this enzyme is important in the synthesis of prostaglandins, leukotrienes and  
PAF, since the non-pancreatic PLA<sub>2</sub> is an extracellular protein which would be difficult to  
regulate, and the next enzymes in the biosynthetic pathways for these compounds are  
intracellular proteins. Moreover, there is evidence that PLA<sub>2</sub> is regulated by protein kinase C  
35 and G proteins [R. Burch and J. Axelrod, Proc. Natl. Acad. Sci. U.S.A., 84:6374-6378  
(1989)] which are cytosolic proteins which must act on intracellular proteins. It would be  
impossible for the non-pancreatic PLA<sub>2</sub> to function in the cytosol, since the high reduction  
potential would reduce the disulfide bonds and inactivate the enzyme.

40 A murine PLA<sub>2</sub> has been identified in the murine macrophage cell line, designated  
RAW 264.7. A specific activity of 2 mols/min/mg, resistant to reducing conditions, was

5 reported to be associated with the approximately 60 kD molecule. However, this protein was not purified to homogeneity. [See, C. C. Leslie et al, Biochem. Biophys. Acta., 963:476-492 (1988)]. The references cited above are incorporated by reference herein for information pertaining to the function of the phospholipase enzymes, particularly PLA<sub>2</sub>.

10 A cytosolic phospholipase A<sub>2</sub> (hereinafter "cPLA<sub>2</sub>") has also been identified and cloned. See, U.S. Patent Nos. 5,322,776 and 5,354,677, which are incorporated herein by reference as if fully set forth. The enzyme of these patents is an intracellular PLA<sub>2</sub> enzyme, purified from its natural source or otherwise produced in purified form, which functions intracellularly to produce arachidonic acid in response to inflammatory stimuli.

15 It is now desirable to identify pharmaceutically useful compounds which inhibit the actions of these phospholipase enzymes for use in treating or preventing inflammatory conditions, particularly where inhibition of production of prostaglandins, leukotrienes and PAF are all desired results. There remains a need in the art for an identification of such anti-inflammatory agents for therapeutic use in a variety of disease states.

20 Numerous pieces of evidence have supported the central role of cPLA<sub>2</sub> in lipid mediator biosynthesis: cPLA<sub>2</sub> is the only enzyme which is highly selective for phospholipids containing arachidonic acid in the *sn*-2 position (Clark et al., 1991, 1995; Hanel & Gelb, 1993); activation of cPLA<sub>2</sub> or its increased expression have been linked with increased leukotriene and prostaglandin synthesis (Lin et al., 1992a, 1992b, 1993); and following activation, cPLA<sub>2</sub> translocates to the nuclear membrane, where it is co-localized with the cyclooxygenase and lipoxygenase that metabolize arachidonate to prostaglandins and leukotrienes (Schievella et al., 1995; Glover et al., 1995). Although these data are compelling, the most definitive evidence for the central role of cPLA<sub>2</sub> in eicosanoid and PAF production came from mice made deficient in cPLA<sub>2</sub> through homologous recombination (Uozumi et al., 1997; Bonventre et al., 1997). Peritoneal macrophages derived from these animals failed to make leukotrienes, prostaglandins, or PAF. The cPLA<sub>2</sub> deficient mice have also been informative of the role of cPLA<sub>2</sub> in disease, since these mice are resistant to bronchial hyperreactivity in an anaphylaxis model used to mimic asthma (Uozumi et al., 1997). Thus, despite the size of the phospholipase A<sub>2</sub> superfamily, cPLA<sub>2</sub> is essential for prostaglandin, leukotriene, and PAF production.

30 diluents, fillers, salts, buffers, stabilizers, solubilizers, and other materials well known in the art. The term "pharmaceutically acceptable" means a non-toxic material that does not interfere with the effectiveness of the biological activity of the active ingredient(s). The characteristics of the carrier will depend on the route of administration. The pharmaceutical composition may further contain other anti-inflammatory agents. Such additional factors and/or agents may be  
35 included in the pharmaceutical composition to produce a synergistic effect with compounds of the present invention, or to minimize side effects caused by the compound of the present invention.

#### 20 Method A

The indole may be alkylated at the c-3 position with the appropriate alkyl bromide and treatment with a lewis acid such as silver(I)oxide or silver tetrafluoroborate in a solvent such as dioxane or THF at elevated temperatures of 50 °C - 100 °C. Alternatively it may be alkylated in a two step procedure by treatment of the indole with n-BuLi in a solvent such as THF or ether followed by ZnCl<sub>2</sub> and then concentrated and treated with the appropriate alkylating agent in a variety of solvents such as THF, ether, toluene or benzene. The indole nitrogen may then be alkylated by treatment with a strong base such as sodium bis(trimethylsilyl)amide, n-BuLi, sodium hydride or potassium hydride in a solvent such as DMF, DMSO or THF followed by exposure to the appropriate alkyl halide. The ester can be hydrolyzed under basic conditions with sodium hydroxide in water and methanol and THF. Alternatively it may be cleaved by treatment with sodium thiomethoxide in a solvent such as THF or DMF at elevated temperatures (50 °C - 100 °C). The product acid may be coupled to a sulfonamide by the agency of a variety of coupling reagents such as DCC, EDCI or carbonyl diimidazole in a solvent such as THF, methylene chloride, dichloroethane or DMF in the presence of a base such as triethyl amine and/or N, N-dimethyl pyridine. In the case of R<sub>1</sub> = nitro the nitro group can be reduced by exposure to Pt/C in the presence of hydrogen in a solvent such as methanol, ethyl acetate or THF. The resulting amine can be acylated or sulfonylated by exposure to the appropriate agent in the presence of a base such as triethyl amine, sodium bicarbonate or pyridine in a biphasic solvent system such as methylene chloride:water (1:1) or THF:water (1:1) or a monophasic organic solvent such as methylene chloride, THF or DMF with triethylamine. The resulting

- 5 acid may then be hydrolyzed and modified as described above. Also in the case  $R^1 = \text{Br}$ , it may be replaced with the copper salt of the desired nucleophile such as thiomethoxide, methoxide or sulphinic acid.

### Method A

5

### Method B

- The indoleglyoxalyl chloride may be reacted with the desired amino ester in a biphasic system with methylene chloride and saturated sodium bicarbonate or in a monophasic system with a solvent such as methylene chloride, ethyl acetate or THF and a base such as triethylamine, Hunigs base or pyridine. The indole nitrogen may then be alkylated with a variety of alkylating reagents in a solvent such as DMF, DMSO or THF and a base such as sodium hydride, n-BuLi or potassium bis(trimethylsilyl)amide. The ester may then be hydrolyzed with sodium hydroxide or lithium hydroxide in a solvent system such as water:methanol:THF.

## Method B

## Method C

10 The 3-carboxyindole is elaborated via reductive amination by allowing the aldehyde to  
condense with an amino ester in a solvent such as methylene chloride or dichloromethane with  
or without acetic acid. The resulting imine is reduced in-situ with a reducing agent such as  
sodium borohydride, sodium cyanoborohydride or sodium triacetoxyborohydride. The acid is  
then prepared by hydrolysis of the resulting ester with sodium hydroxide or lithium hydroxide  
in a solvent system such as water:methanol:THF.

15

## Method C

5

## Method D

5-benzyloxyindole may be treated with a base such as methyl or ethyl grignard and acylated at the 3-position with ethyloxychloride in a suitable solvent such as ether or THF. The indole nitrogen may then be alkylated with a benzylbromide by the action of a base such as sodium hydride or n-butyllithium in a solvent such as THF or DMF. The ester is then hydrolysed under basic conditions with sodium hydroxide or tetrabutylammonium hydroxide in a suitable solvent system such as water:MeOH:THF. Coupling of the appropriate aminoester may then be effected by the use of a coupling agent such as DCC or EDCI in a solvent such as methylenechloride, THF or DMF. The target acid may then be revealed by hydrolysis of the ester under the same conditions discussed above.

## Method D

5

## Method E

Indole-3-acetic acid was alkylated with an appropriate alkyl bromide which was then subjected  
 10 to Suzuki coupling conditions using Pd(PPh<sub>3</sub>)<sub>4</sub> as a catalyst in a mixed solvent (ethanol-  
 benzene-water) at elevated temperature to give the 1-alkyl-5-substituted indole.

## Method E

5

## Method F

Alkylation of the nitrogen atom of I with a suitable base such as sodium hydride or potassium carbonate and an alkyl halide gave the aldehyde II. The aldehyde could be transformed to the thiazolidinedione III using a base such as piperidine and isolated with an acid such as acetic acid. Deprotonation with a suitable base such as sodium hydride and alkylation on the nitrogen atom of the thiazolidinedione with selected electrophiles such as alkyl or benzyl halides provided compounds such as IV.

10

## Method F

5

## Method G

The nitro-indole I was converted to the unsaturated ester via a Horner-Wittig reaction with trimethoxyphosphonoacetate in a suitable solvent such as tetrahydrofuran. Reduction of the nitro group of II can be accomplished via hydrogenation with palladium on carbon in the presence of hydrogen and acylation of the resulting amine under Schotten-Bowmann conditions to give amides such as III. Saponification of the ester function gave the acid-indole IV.

15

## Method G

5

## Method H

5-Chloro-2-methylindole could be reductively alkylated at the 3-position with a suitable aldehyde in the presence of an acid such as trifluoroacetic acid and a reducing agent such as triethylsilane in a suitable solvent such as methylene chloride to give the ester II. The nitrogen atom could be alkylated by treatment with a suitable base such as sodium hydride and diphenyl bromo methane and the resulting compound III could be saponified to give IV.

15

## Method H

5

## Method I

The starting indole is C3 functionalized by either reaction of DMF/ $\text{POCl}_3$  or by reacting the magnesium salt of the indole with methyl oxalyl chloride. The resulting esters and aldehydes were then Nalkylated by treating the salt of the indole, generated by treating the indole with a strong base, with a variety of alkyl halides. In the case of the aldehydes, when  $\text{r}'$  is a nitro group, the nitro is reduced to the amine using  $\text{Pt/C}$  and  $\text{H}_2$  or copper acetate/sodium borohydride and then acylated using various acid chlorides, isocyanates, chloroformates or reductively alkylated using aldehydes and sodium triacetoxyborohydride. These aldehydes could then be oxidized to the desired acid which could be coupled to an amino alkyl or aryl esters by an EDCI coupling method or by first transforming the acid into the acid chloride under the action of oxalyl chloride and the reacting this with an amino alkyl or aryl ester. These were then hydrolyzed to yield the final product. The esters generated above could be treated in a similar fashion. The ester could be hydrolyzed and then coupled to an amino alkyl or aryl esters by an EDCI coupling method or by first transforming the acid into the acid chloride under the action of oxalyl chloride and the reacting this with an amino alkyl or aryl ester. These were then hydrolyzed to yield the final product.

20

## Method I(a)

5

## Method I(b)

## Method J

10

The starting amine was treated with various sulfonyl chlorides in the presence of pyridine and then the excess sulfonylchloride was scavenged by adding a polymer bound amine. The

5 desired products where then hydrolyzed using sodium hydroxide in THF/MeOH and the reaction was aidified using IR-120 resin to yield the desired products.

## Method J

## Method K

10

The starting indole was bis alkylated by the addition of a strong base such as sodium hydride and then an alkylating agent such as an alkyl or aryl halide followed by the hydrolysis of the resulting ester with sodium hydroxide in THF/MeOH. The acid was then coupled with an alkyl or aryl amino ester and then hydrolyzed to yield the desired acid.

## Method K

5 **Example 1****4-[(5-[[[(cyclopentyloxy)carbonyl]amino]-1-propyl-1H-indol-3-yl)methyl]-3-methoxybenzoic acid**

Step 1 - To a solution of 5-nitro indole (21.24 g, 131 mmol) in dioxane (128 mL) in a reaction vessel wrapped in aluminum foil is added silver(I)oxide (30.34 g, 131 mmol, 1.5 eq) and methyl 4-(bromomethyl)-3-methoxy-benzoate (34 g, 131 mmol) and the mixture is brought to 60 °C and stirred 20 h. The reaction is cooled, filtered through celite, taken up in ethyl acetate (500 mL), washed with brine (2 X 50 mL), dried (MgSO<sub>4</sub>) and filtered. The crude material was purified by silica chromatography (15% ethyl acetate / hexanes) to afford the desired product (5.8 g, 55%).

15 Step 2 - The C3-alkylated indole (1.5 g, 4.4 mmol) was dissolved with 15 mL THF. In a separate flask, NaH (185 g, 4.61 mmol) was suspended with 25 mL THF at 0 °C. The solution of starting material was cannulated into the NaH suspension, giving a deep red solution. This was then allowed to stir at room temperature for 10 minutes. 1-iodopropane was added (0.47 mL, 1.1 mmol) and the reaction was allowed to proceed overnight at room temperature. As the reaction was not complete (TLC) and additional 0.5 mL of 1-iodopropane was added and the reaction continued for another 3 h. There was no change in the TLC and the reaction was poured into cold 1 N HCl and extracted with CH<sub>2</sub>Cl<sub>2</sub> (3 X 75 mL). The combined organic layers were dried over MgSO<sub>4</sub>, filtered and evaporated to yield the crude N-alkylated nitroindole. The crude material was absorbed onto silica and loaded onto a silica gel column. 25 The column was eluted with 100% CH<sub>2</sub>Cl<sub>2</sub> to give the pure yellow N-alkylated nitroindole (0.96 g, 57%).

Step 3 - The N-alkylated nitroindole (0.95 g) was dissolved with 40 mL anhydrous THF. The system was purged with argon. To the clear, yellow solution, Pt/C (0.462 g) was added. The argon was then removed by evacuation and hydrogen was introduced to the system. The reaction was stirred 6.5 h. The hydrogen was evacuated and argon was then purged through the system. The reaction mixture was filtered through celite with THF. The solvent was removed by rotary evaporation to give the crude amine as a dark oil. 30 Chromatography (5% ethyl acetate/CH<sub>2</sub>Cl<sub>2</sub>) afforded the desired product (0.7 g, 80%)

Step 4 - The amine from above (0.7 g) was dissolved in 40 mL CH<sub>2</sub>Cl<sub>2</sub>. 4-methylmorpholine (0.3 mL, 3.0 mmol) and cyclopentyl chloroformate (383 mg, 2.57 mmol) were then added to give a yellow/orange solution. The reaction was allowed to proceed at room temperature for 3 h. The reaction mixture was acidified with 1 N HCl and the mixture was extracted with 50 mL CH<sub>2</sub>Cl<sub>2</sub>. The combined organic phases were washed with brine, dried over MgSO<sub>4</sub>, filtered and concentrated to give the crude carbamate. The crude product was 40 absorbed onto silica gel and loaded onto a silica gel column. The column was eluted with 100% CH<sub>2</sub>Cl<sub>2</sub> to afford the desired product (0.87 g, 39%) as a yellow foam.

- 5           Step 5 - The carbamate (0.831 g) was dissolved with hydrolysis solution (2:1:1 THF:MeOH:2N NaOH) and the reaction was allowed to proceed for 5.25 h. The reaction was acidified to pH 2 with 2N HCl and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was washed with water and brine. The combined organic layers were then dried over MgSO<sub>4</sub>, filtered and evaporated to yield the crude acid, which was recrystallized from CH<sub>2</sub>Cl<sub>2</sub> to afford the title  
10 compound (0.575 g, 71%) as pink crystals.

Table I reports data for the compounds described in the examples above in cPLA2 inhibition assays (described below). In the data columns of Tables I and II, assay results are reported as a percent inhibition at the concentration specified.

10

Coumarin Assay

7-hydroxycoumarinyl 6-heptenoate was used as a monomeric substrate for cPLA2 as reported previously (Huang, Z. et al., 1994, Nalytical Biochemistry 222, 110-115). Inhibitors were mixed with 200  $\mu$ L assay buffer (80 mM Heped, pH 7.5, 1 mM EDTA) containing 60  $\mu$ M 7-hydroxycoumarinyl 6-heptenoate. The reaction was initiated by adding 4  $\mu$ g cPLA2 in 50  $\mu$ L assay buffer. Hydrolysis of the 7-hydroxycoumarinyl 6-heptenoate ester was monitored in a fluorometer by exciting at 360 nm and monitoring emission at 460 nm. Enzyme activity is proportional to the increase in emission at 460 nm per minute. In the presence of a cPLA2 inhibitor, the rate of increase is less.

15 Compounds of the present invention were also tested for *in vivo* activity in a rat paw edema test according to the procedure described below. The results are reported in Table II.

Rat Carrageenan-Induced Footpad Edema Test

20 Each compound was suspended in 0.3ml absolute ethanol, 0.1 ml Tween-80 and 2.0 ml Dulbecco's PBS (without calcium or magnesium). To this mixture, 0.1ml 1N NaOH was added. After solution was complete, additional amounts of PBS were added to adjust the concentration to 1 mg/ml. All compounds remained in solution. Compounds were administered i.v. in a volume of 5 ml/kg to male Sprague Dawley rats at the same time that edema was induced by injection of 0.05ml of 1% Type IV carrageenan into the hind footpad. Footpad volume was measured before dosing with compound and 3 hours after dosing with  
25 carrageenan.

# INTERNATIONAL SEARCH REPORT

national application No.

PCT/US 99/03898

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claim 33  
is directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

## Continuation of Box I.2

Present claims 1-11 relate to an extremely large number of possible compounds/products. Clarity and conciseness within the meaning of Article 6 PCT is to be found, however, for only a part of the compounds/products claimed. In the present case, the claims so lack clarity and conciseness that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be clear and concised, namely those parts relating to the compounds/products prepared in the examples and closely related homologous compounds, i.e. those indol derivatives where the 4- and 7-position are not substituted, R4=H or alkyl and the 6-position can be substituted by H or Hal (Art. 15 PCT, Rule 33 PCT; Examination guidelines, Part B - III, 3.6).

The applicant's attention is drawn to the fact that claims relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
